Factsheet

Microsoft InTune

Ensure that all your devices are secured, protected, and organised within your business with a trusted solution from Microsoft.

What is InTune?

Microsoft Intune is a cloud-based service that focuses on mobile device and mobile application management. You control how your organisation's devices are used, including mobile phones, tablets, and laptops. You can also configure specific policies to control applications.

Intune integrates with Azure Active Directory to control who has access, and what they can access. It also integrates with Azure Information Protection for data protection, and with Microsoft 365 suite of products, so you can seamlessly stay productive on any devices, all whilst keeping your information secure.

Management to suit you

Manage your devices

With Intune, you manage devices using an approach that's right for you. For organisation-owned devices, you may want full control over the devices, including settings, features, and security. “Enrol” these devices and users in Intune and once enrolled, they receive your rules and settings through policies configured in Intune.

And for personal devices or bring-your-own devices (BYOD), you can give your users options. Manage a work profile on their devices so they can access the information they need, without compromising on security.

When devices are enrolled and managed in Intune, administrators can:

- See the devices enrolled and get an inventory of devices accessing organisation resources.
- Configure devices so they meet your compliance standards.
- Push certificates to devices so users can easily access your Wi-Fi network, or use a VPN to connect to your network.
- See reports on users and devices that are compliant, and not compliant.
- Remove organisation data if a device is lost, stolen, or not used anymore.

Manage your applications

Mobile application management (MAM) in Intune is designed to protect organisation data at the application level, including custom apps and store apps. App management can be used on organisation-owned devices and personal devices.

With app management, administrators can:

- Add and assign mobile apps to user groups and devices.
- Configure apps to start or run with specific settings enabled and update existing apps already on the device.
- See reports on which apps are used and track their usage.
- Do a selective wipe by removing only organisation data from apps.

Build a resilient and secure business and protect work data with Microsft Intune
